

How to manage the contagious patient: a demonstration

Ever tried placing a urine catheter in a bitch with leptospirosis? Caring for a patient in isolation asks for a different kind of critical care thinking skills. This lecture will train your mind and body to help you to keep your ward, yourself and your environment clean and safe. It all starts a long way before the isolation ward.

Refreshing GI physiology: a juicy story

Put food in a tube and at the other end faeces comes out. How does this happen? How amylase, lipase and trypsin, the workforce of digestion, get in action; how digestion influences blood pH; how the liver is the port where nutrients are unloaded to be used in the rest of the body: all this and more will be discussed in this lecture. First thing in the morning and it will get your juices flowing.
